

## Chapter 2.2

### Problem 3

Let  $A = \begin{bmatrix} 7 & 3 \\ -6 & -3 \end{bmatrix}$ . The inverse of a 2x2 matrix is:  $\frac{1}{ad-bc} \begin{bmatrix} a & b \\ c & d \end{bmatrix}$ . Thus,

$$A^{-1} = \frac{1}{(7)(-3)-(3)(-6)} \begin{bmatrix} -3 & -3 \\ 6 & 7 \end{bmatrix} = \frac{1}{3} \begin{bmatrix} -3 & -3 \\ 6 & 7 \end{bmatrix}.$$

### Problem 6

Solve the linear system:  $\begin{cases} 7x_1 + 3x_2 = -9 \\ -6x_1 - 3x_2 = 4 \end{cases}$

$$\begin{aligned} A\vec{x} &= \begin{bmatrix} -9 \\ 4 \end{bmatrix} \Rightarrow \vec{x} = A^{-1} \begin{bmatrix} -9 \\ 4 \end{bmatrix} \Rightarrow \vec{x} = \frac{1}{3} \begin{bmatrix} -3 & -3 \\ 6 & 7 \end{bmatrix} \begin{bmatrix} -9 \\ 4 \end{bmatrix} \\ &= \frac{1}{3} \begin{bmatrix} 27 \\ -54 \end{bmatrix} \begin{bmatrix} -12 \\ 28 \end{bmatrix} = \frac{1}{3} \begin{bmatrix} 15 \\ -26 \end{bmatrix} \end{aligned}$$

### Problem 8

$$A = PBP^{-1} \Rightarrow P^{-1}A = BP^{-1} \Rightarrow P^{-1}AP = B.$$

### Problem 32

Find  $A^{-1}$  if it exists when  $A = \begin{bmatrix} 1 & 2 & -1 \\ -4 & -7 & 3 \\ -2 & -6 & 4 \end{bmatrix}$ . We will augment by  $I_3$  and row reduce.

$$\left[ \begin{array}{ccc|ccc} 1 & 2 & -1 & 1 & 0 & 0 \\ -4 & -7 & 3 & 0 & 1 & 0 \\ -2 & -6 & 4 & 0 & 0 & 1 \end{array} \right] \sim \left[ \begin{array}{ccc|ccc} 1 & 2 & -1 & 1 & 0 & 0 \\ 0 & 1 & -1 & 4 & 1 & 0 \\ 0 & -2 & 2 & 2 & 0 & 1 \end{array} \right] \sim \left[ \begin{array}{ccc|ccc} 1 & 2 & -1 & 1 & 0 & 0 \\ 0 & 1 & -1 & 4 & 1 & 0 \\ 0 & 0 & 0 & 10 & 2 & 1 \end{array} \right]$$

Because  $A$  is not row equivalent with  $I_3$ ,  $A$  is not invertible.

## Chapter 2.3

### Problem 12

- (a) False. Matrix multiplication is not commutative.
- (b) False. If the map  $T$  were onto or one-to-one, this would be true.
- (c) False. Not every  $n \times n$  matrix spans  $\mathbb{R}^n$ .

(d) True. If  $A$  had  $n$  pivots,  $A\vec{x} = \vec{b}$  would only have the trivial solution by the Invertible Matrix Theorem.

(e) True. If a matrix is invertible, so is its transpose. This is Theorem 6.

### Problem 20

Yes, it is possible. According to the invertible matrix theorem, if an  $n \times n$  matrix  $A$  spans  $\mathbb{R}^n$ , then  $A\vec{x} = \vec{b}$  has **at least one** solution for all  $\vec{b}$  in  $\mathbb{R}^n$ .

### Problem 21

The existence of some  $\vec{v}$  such that  $C\vec{u} = \vec{v}$  has more than one solution does not prevent  $C$  from spanning  $\mathbb{R}^n$ . As in number 20, the invertible matrix theorem says that if  $C\vec{u} = \vec{v}$  has **at least one** solution for all  $\vec{v}$  in  $\mathbb{R}^n$ , then it spans  $\mathbb{R}^n$ .

### Problem 28

Assume that  $AB$  is invertible and that  $B$  is not invertible. This means that  $B$  is not one-to-one, which implies that there exists an  $x$  and a  $y$  such that  $Bx = By$ . However, this would also imply that  $ABx = AB y$  which cannot be true because  $AB$  is one-to-one by the invertible matrix theorem. This is a contradiction. Therefore,  $B$  must be invertible.

## 1 Chapter 3.1

### 1.0.1 Problem 10

Calculate the determinant of  $A$  when  $A = \begin{bmatrix} 1 & -2 & 5 & 2 \\ 0 & 0 & 3 & 0 \\ 2 & -6 & -7 & 0 \\ 5 & 0 & 4 & 4 \end{bmatrix}$ .

$$\begin{vmatrix} 1 & -2 & 5 & 2 \\ 0 & 0 & 3 & 0 \\ 2 & -6 & -7 & 0 \\ 5 & 0 & 4 & 4 \end{vmatrix} = 3 * \begin{vmatrix} 1 & -2 & 2 \\ 2 & -6 & 5 \\ 5 & 0 & 4 \end{vmatrix} = -15 * \begin{vmatrix} -2 & -2 \\ -6 & 5 \end{vmatrix} = -12 * \begin{vmatrix} 1 & -2 \\ 2 & -6 \end{vmatrix}$$

$$\det(A) = -15(-10 + 12) - 12(-6 + 4) = -30 + 24 = -6$$

### 1.0.2 Problem 12

$$\begin{vmatrix} 1 & -2 & 5 & 2 \\ 0 & 0 & 3 & 0 \\ 2 & -6 & -7 & 0 \\ 5 & 0 & 4 & 4 \end{vmatrix} = 4 * \begin{vmatrix} -1 & 0 & 0 \\ 6 & 3 & -3 \\ -8 & 4 & -3 \end{vmatrix} = -4 * \begin{vmatrix} 3 & -3 \\ 4 & -3 \end{vmatrix} \\ = -4(-9 + 12) = -4 * 3 = -12.$$

**1.0.3 Problem 14**

$$\begin{vmatrix} 6 & 3 & 2 & 4 & 0 \\ 9 & 0 & -4 & 1 & 0 \\ 8 & -5 & 6 & 7 & 1 \\ 3 & 0 & 0 & 0 & 0 \\ 4 & 2 & 3 & 2 & 0 \end{vmatrix} = \begin{vmatrix} 6 & 3 & 2 & 4 \\ 9 & 0 & -4 & 1 \\ 3 & 0 & 0 & 0 \\ 4 & 2 & 3 & 2 \end{vmatrix} = 3 * \begin{vmatrix} 3 & 2 & 4 \\ 0 & -4 & 1 \\ 2 & 3 & 2 \end{vmatrix}$$

$$= 12 * \begin{vmatrix} 3 & 4 \\ 2 & 2 \end{vmatrix} - 3 * \begin{vmatrix} 3 & 2 \\ 2 & 3 \end{vmatrix} = 12(6-8) - 3(9-4) = -24 - 15 = -39$$
