

To run the index, execute one of the following commands:

```
lein run
```

```
./run.sh
```

This will start with a prompt that asks the user to enter a filename to use as the index source. After creating the index, it will present the user with an interactive REPL to allow them to search the index.

Optionally, you can allow supply a filename at runtime to load the index from:

```
lein run [filename]
```
